## RF Design - IP3

**Exercise 1**: If the two input frequencies are 150 and 155 MHZ, what are the frequencies of the third-order products? If these two frequencies represent the lower and upper frequencies of a channel, what is the channel bandwidth? Where would the third-order products fall relative to the adjacent channel?

roducts fall relative to the adjacent channel?

$$2\omega_1 - \omega_2 = 2 \cdot 150 - 155 = 300 - 155 = 145$$
 $2\omega_2 - \omega_1 = 2 \cdot 155 - 150 = 310 - 150 = 160$ 
 $band width = 155 - 150 = 5 MHz$ 
 $145 & 160$  are at edge of adjacent channels:

 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 5 MHz$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 5 MHz$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 5 MHz$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 5 MHz$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 5 MHz$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 5 MHz$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 
 $2\omega_1 - \omega_2 = 2 \cdot 155 - 150 = 160$ 

**Exercise 2**: An amplifier has an OIP3 of 30dBm. If it is required that the adjacent channel power be 30dB below the in-channel power, what is the maximum output power we should try to get from this amplifier?

Both Pour decreases by 
$$\frac{2}{3}$$

Roof  $\frac{2}{3}$ 

IMD decreases by  $\frac{2}{3}$ 

Pour =  $\frac{3}{3}$ 

Roof  $\frac{2}{3}$ 

IMD decreases by  $\frac{2}{3}$
