

# EECE 478: Computer Graphics

## Vision and Viewing

---

---

---

---

---

---

---

---

## Learning Objectives

- Real-world optics
  - Describe how images are formed by light in the world
  - Describe the roles of the eye, lens and retina in forming images
- Simulated optics
  - Define a pinhole/synthetic camera model
  - Define the simplifications made in the simple camera model used by OpenGL
  - Describe the internal and external camera parameters

---

---

---

---

---

---

---

---

## Learning Objectives

- Modelling and Rendering
  - Describe how a 3D model is rendered to the screen
  - Describe the stages of a typical 3D graphics pipeline

---

---

---

---

---

---

---

---

## Vocabulary

- Image
- Viewer
- View
- Viewing geometry
- Eye
- Retina
- Lens
- Light field
- Pinhole camera
- Projection
- Centre of projection
- Field of view
- Focal length
- Projection plane
- Clipping
- Light source

---

---

---

---

---

---

---

---

## Vocabulary

- 3D Model
- Rendering
- Pixel
- Graphics pipeline
- Scene geometry
- Projection
- Rasterization

---

---

---

---

---

---

---

---

## Real-world Images

---

---

---

---

---

---

---

---

## The Eye

---

---

---

---

---

---

---

---

## The Eye

### *Iris*

- Restricts amount of light entering eye

### *Lens*

- Focuses light rays onto retina

### *Retina*

- Surface on which image is formed

---

---

---

---

---

---

---

---

## Pinhole Camera Model

### Simplifications:

- All rays pass through single point (*pinhole*)
- No lens (all rays are straight)
- Imaging surface is plane (*imaging plane*)

---

---

---

---

---

---

---

---

### Pinhole Camera

$$z_p = -d$$

$$x_p = -\frac{x}{z/d}$$

$$y_p = -\frac{y}{z/d}$$

---

---

---

---

---

---

---

---

### Pinhole Camera (plane forward)

$$z_p = d$$

$$x_p = \frac{x}{z/d}$$

$$y_p = \frac{y}{z/d}$$

---

---

---

---

---

---

---

---

### Synthetic Camera Model

1. Viewer (*camera*) is defined separately from objects
2. Image computed with simple projective geometry
  - Project all object points through centre of projection onto projection plane
  - Image is rectangular subset of projection plane. Points that project outside of image are clipped

---

---

---

---

---

---

---

---

## Clipping

- Projection plane is limited in size
  - If point projects outside of *image* it is not displayed (*clipped*)
  - $w/h$  is *aspect ratio*
  - $\theta$  is *field of view*

---

---

---

---

---

---

---

---
